

docQcollate is an add on option to docQticket which enables users to combine multiple documents from different applications, including PDFs, into a single job ticketed job for submission to the CRD print room. It is ideal for preparation and submission of documentation like meeting agenda and minutes with attachments.

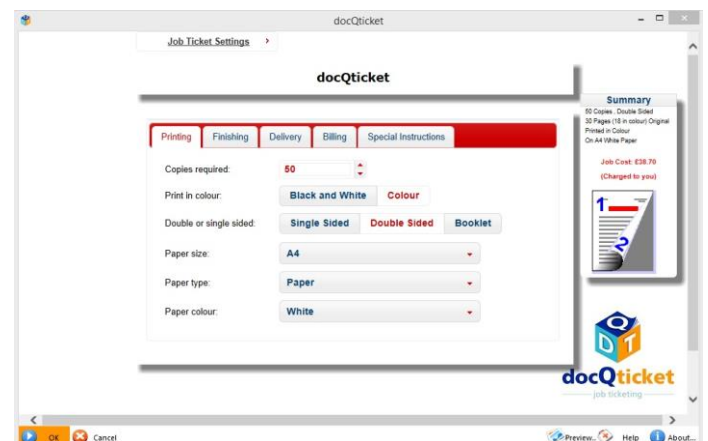

File/print or drag & drop

Documents may be collated by a sequence of simple file/print actions on the selected documents into a print queue named docQcollate. Alternatively, after opening the docQcollate application an Add button allows browsing to add additional documents, or they may be simply dragged & dropped into the open application.

Preview and formatting

After all required documents have been loaded into docQcollate the whole combined document can be scrolled through and previewed page by page. The individual documents can be re-ordered as necessary, while separators may be automatically inserted or removed as required between the individual documents. When satisfied with the layout a click of the "Print" icon passes the whole combined job into docQticket for completion of a job ticket prior to submission to the print room.

Features of docQcollate

- Combine PDF, MS Word, Excel, and other documents into one print job
- Simple file/print or drag & drop collation
- Page by page preview
- Change document order up or down
- Add or remove document separators
- Seamless feed into docQticket

Documents supported

Any document may be added into docQcollate so long as there is an application associated with that document extension which supports the "Print to" function of the Windows Explorer shell.
