

# Case study success story

Global logistics company - replacing pre-printed multipart stationery

## The requirement

- The objective for this global logistics company was to replace the various operating countries' pre-printed multipart logistics forms with a centrally managed electronic forms system, supporting all local languages, with minimal changes to the host IBM i-series mainframe application, with output to any MS Windows supported cut sheet laser printer.

Replace pre-printed multipart stationery globally

Centrally managed electronic forms for all languages

Minimise changes to host system application

Printer independence on output

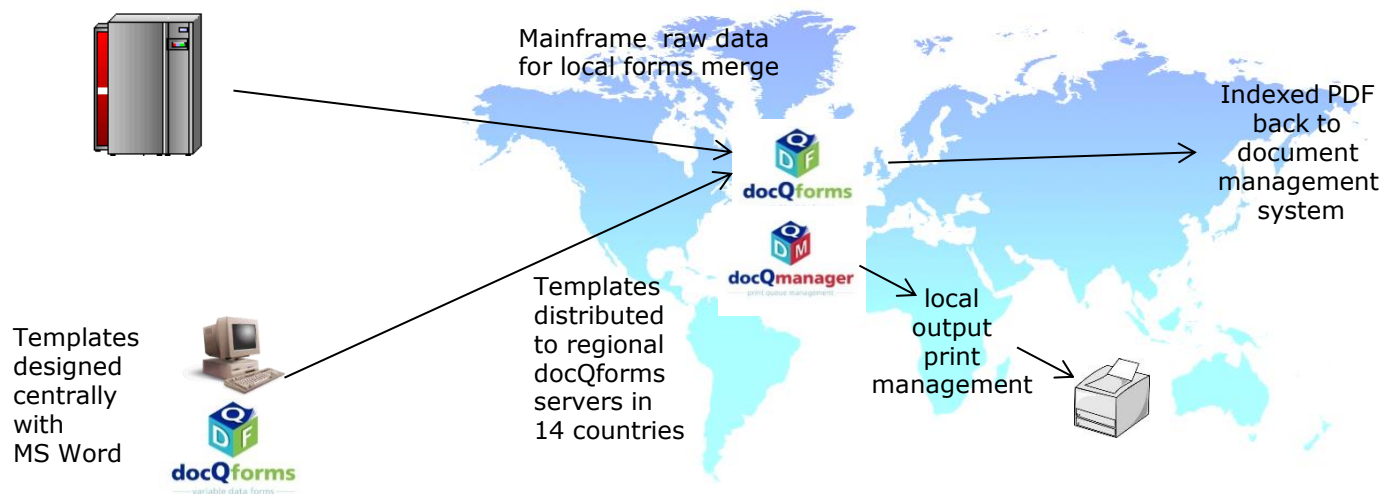

# Case study success story

Global logistics company - replacing pre-printed multipart stationery

## The solution

- docQforms was chosen for managing forms template design using the simplicity of MS Word before they are distributed out to the docQforms servers in each region. Central mainframe raw data goes out to each regional office docQforms server for merging with the local forms template before flowing into docQmanager which is configured to automatically route each job to the required printer, at the same time also creating and filing an indexed PDF of the output back into the document management system.

## Benefits

- Centrally managed electronic forms and elimination of costly pre-printed stationery.
