

Case study success story

Meeting a requirement for print job sub-set stapling

The requirement

- A MFP reseller wanted to replace existing equipment from another manufacturer in a print room. Stapling subsets of pages within a job was a requirement for one print application but the preferred proposed replacement equipment did not have that capability

Host application

Sub-set stapled output required

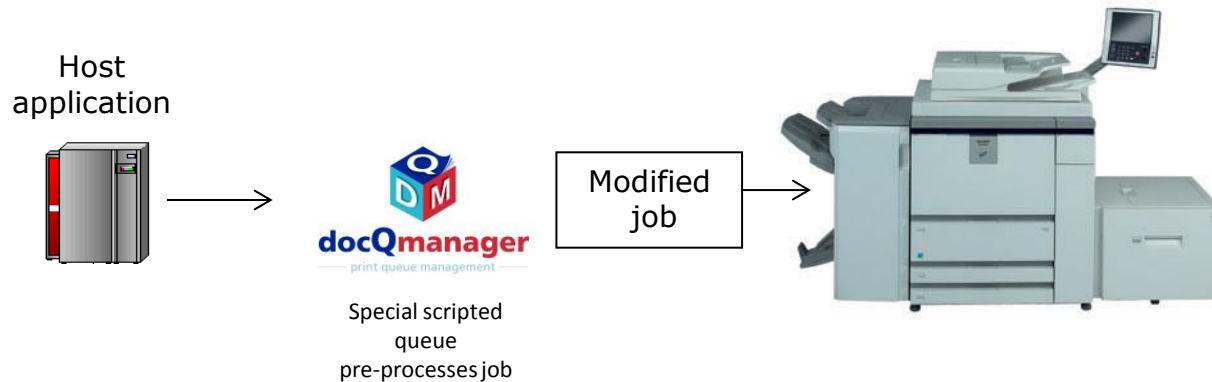

But - preferred replacement MFP does not sub-set staple

Case study success story

Meeting a requirement for print job sub-set stapling

The solution

- doc-Q-manager was installed to manage jobs to the MFP with a special queue configured with a custom script which pre-processes jobs needing to be sub-set stapled. Users simply “drag & drop” jobs to the special queue to action sub-set stapling and doc-Q-manager does the rest

Benefits

- The customer obtained the preferred equipment and the reseller succeeded in the sale
