

Business Cards for docQticket - Ideal for in-house printing of business cards in order to maintain corporate branding, this add-on for docQticket provides a templating mechanism for the easy creation of business cards.

A simple Business Card Builder allows authorised users to design a card, uploading a PDF background, then designing which text fields are to be over-printed onto this.

Business Card Builder - Example card Duplex

Background 1 of 6 Complete

Card
Background: You can upload a PDF to use as a background to the business card. This should be the same dimensions as the card. (85mm x 55mm)
PDF Upload: Choose File | No file chosen | Upload

These fields can be pre-populated from Active Directory details such as Job Title, Telephone, Email etc. as well as being locked to prevent the user from changing them. Fields can use any fonts on the server, in any colour, and can even use character sets such as Japanese and Russian.

The rear of the card can include a QR code for either a web link, or it can be a vCard contact card that can be read by a mobile phone.

A live preview in the Business Card Builder shows the resulting PDF business card. This can also be downloaded.
